ABOUT US

US

We are a company specialized in software development, focused on creating innovative technological solutions that optimize processes and improve our clients' productivity.

MISSION

To develop efficient, secure, and scalable software solutions that meet our clients' needs, contributing to their growth through innovative technology.

VISION

To become a leading software development company at both national and international levels, recognized for innovation, quality, and commitment to our clients.

TEAM

**Gabriel Hernández
Yukioayax Canek
321058526**

Project Manajer

The heart and soul of the company. Also a person who comes up with an idea and then transforms it to real life.

**Atilano Velázquez
Leonardo
321331656**

Requirements Analyst

Gathers, analyzes, and documents stakeholder needs, translating them into clear, testable technical requirements for the compiler development team.

**Sánchez Bautista
Luis Yael
321184995**

Software Architect

Designs the overall system architecture, defines technology stack and design patterns, ensuring scalability, maintainability, and software quality.

**Trejo Olvera
Emmanuel
424138220**

Lead Developer

Implements compiler functionalities according to defined requirements, follows coding best practices, and actively collaborates with the technical team.

**Uribe Vázquez
Rodrigo
320560154**

Tester (QA)

Evaluates applications to identify bugs, errors, or gaps in requirements before the product reaches the end user.

THE CORE PROBLEM

During development, syntactically correct code can still be logically incoherent. A program may follow every grammatical rule yet fail because it attempts impossible operations.

During the documentation process, manuals are often outdated or misleading. Junior developers struggle to understand legacy systems where data types, scopes, and variable assignments no longer match the actual code.

The result: technical debt, slow onboarding, and broken documentation.

The documentation:

OUR SOLUTION

Our tool serves as a critical educational and diagnostic tool for junior developers by identifying logical errors and helping in documentation generation.

It assists comprehension of data flow and variable assignation, helping juniors define exactly how components interact and what data types are required.

For debugging, it functions as an automated guide, flagging "legal" but broken logic before the code even runs.

It facilitates the elimination of the so common technical debt present in most big projects and getting new hires up to speed quicker .
